

Remote Ops

Command drones anywhere, anytime — from your browser.

Rapid response or scheduled flight. Hand activated or Dock launched. One drone or many at once. Skydio Remote Ops software lets you fly wherever you want, whenever you want, and however far you want when paired with Skydio X10.

Let your drones work for you.

Stationed where the work happens, docked X10s become an extension of your team by enabling you to respond immediately to alarms, notifications, or any situation where you need to capture real-time data for quick decision-making. Increase productivity by automating tasks such as routine security patrols, asset inspections, and more with autonomous missions controlled from a central location.

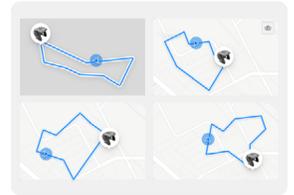

Multiple drones. Multiple missions.

Run your entire drone fleet across multiple sites and operate multiple drones from one Remote Ops command center.

Autonomous operations.

Capture repetitive data sets over time with advanced mission planning tools and automated mission scheduling.

Real-time situational awareness.

Live stream flights to all stakeholders to provide a common operating picture, enabling teams to make informed decisions in real time.

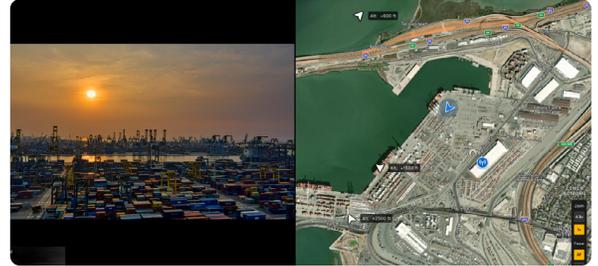

Operate with context.

Augmented reality overlays bring critical waypoint and map data to the flight screen so operators always know what they're looking at.

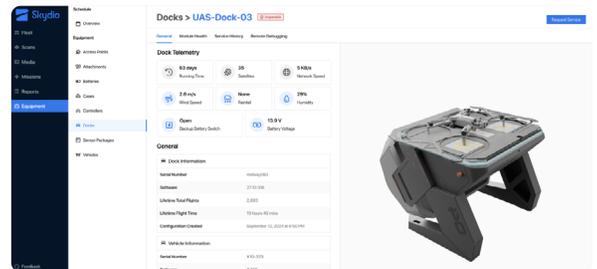

Fly together.

Command fleet-wide with a single piece of flight software for all your Skydio drones, whether docked or handheld. Seamlessly hand off control between pilots so your field units can do their jobs, and your pilots can do the flying.

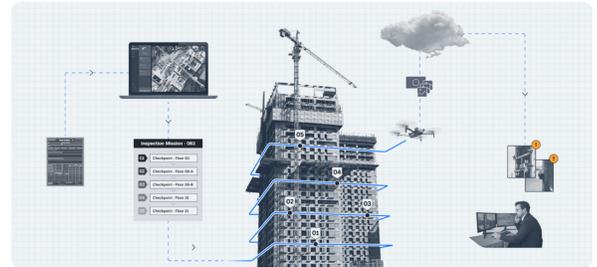

Fleet management, made simple.

Keep equipment ready for action by managing drones, docks, and software licenses with data-driven maintenance insights. Automatically track pilot flight hours and logins so you can focus on the job at hand instead of administrative tasks.

Integrate into existing workflows.

Initiate flights automatically based on triggers, notifications, schedules, and more from the systems you use daily. Deliver datasets captured during flight to post-processing and AI tools to bring your data to life or automatically send the data to digital evidence management systems or cloud storage solutions.

Fly wherever you need to be with advanced autonomy and onboard AI.

Trustworthy obstacle avoidance lets you fly freely in any direction. Sideways, up, down and backwards — even when you can't see your drone. So you can easily complete complex missions with total confidence.

Navigate around obstacles safely.

Operate in dense urban canyons.

Get your drone home safe, day or night.
